The latest data to show that the overall power situation has gotten worse, with the ratio of peak-load shortages now the highest in a decade. In absolute terms, the power deficit has hit record levels and seems almost certain to further deteriorate without real reforms in the ground. Even as aggressive technical and commercial loans in the power sector continue to pour in at over a third of total generation, per-capita capacity addition is now well below target. A shortage of equipment and skills is blamed for the stalled slow-down in augmenting power capacity. But the death of incentives can only be relative. In fact, the peak load of the sector is the continuing revenue linkage in the state power policies and state power utilities are unacceptably high aggregate technical and commercial losses, much of it plain theft of electricity. Given the preponderance of state utilities in power supply, the fact that they remain very much in red does affect investor confidence and slows funds flow.

47. India's power generation is largely controlled by private sector.
48. No state in power sector in India has not yet attained its desired level.
49. India's power sector is not as attractive comparable to developed countries.
50. Power theft is one of the major components of revenue losses in power sector.

## TEST - II : ENGLISH LANGUAGE

**Directions (51-65) :** Read the following passage carefully and answer the questions given below it. Certain words are given in bold in the passage to help you locate them while answering some of the questions.

It is difficult to compare countries, because various factors such as size, culture, history, geography, natural endowments, geopolitics and internal polity come into play. There are some goals which can be achieved by smaller countries, but sometimes smaller countries find it difficult to embark upon certain big technological plans even if they have the funds, because the size of the domestic market is too small. If we consider the bigger countries, the closest competitor to India is China, though there are many essential differences.

The Chinese vision is to propel the country for entry into the ranks of mid-level developed nations by the middle of the twenty-first century. Acceleration of the nation's economic growth and social development by relying on advances in science and technology is pivotal to this.

Discussions describing the Chinese vision state that science and technology constitute premier productive forces and represent a great revolutionary power that can propel economic and social development. It is interesting to note that the main lessons the Chinese have drawn from their past performance is their failure to promote science and technology as strategic tools for empowerment. They also point to the absence of mechanisms and institutions in their economic activity to promote dependence on science and technology. Finally, they hold that their scientific and technological efforts were not

oriented towards economic growth. As a consequence, they conclude, a large number of scientific and technological achievements were not translated into productive forces as they were too far removed from China's immediate economic and social needs. The Chinese vision is therefore aimed at exploiting state-of-art science and technology to enhance the nation's overall power and strength, to improve the people's living standards, to focus on solving problems encountered in large-scale industrial and agricultural production and to effectively control and alleviate poverty brought on by population, resources and the environment. By the year 2050, China had aimed at bringing the main industrial sectors up to the technological levels achieved by the developed countries in the 1970s or 80s, and by 2020 to the level they would have attained by the early twenty-first century. The aim is to bridge the overall gap with the advanced world. There is a special emphasis on research and development of high technologies that would find defence applications. Some of these technologies are critical for improving the features of key conventional weapons. Some technologies are meant for enhancing future military capabilities. Other efforts are aimed at maintaining the momentum to develop capabilities for cutting-edge defence technologies. They call for unswerving efforts in this regard with the aim of maintaining effective self-defence and nuclear deterrent capabilities and to enable parity in defence, science and technology with the advanced world.
