Compare $\triangle ABC$ and $\triangle ADB$														
$\angle ABC = \angle ADB = 90^\circ$														
$\angle BAD$ is common	Data and construction

	OR	
	If the quadratic equation $(b - c) x^2 + (c - a) x + (a - b) = 0$ has equal roots, then show that $2b = a + c$.	
	Ans. :	
	Let the required years are x	
	After x years the age of A is $= x + 19$	
	After x years the age of B is $= x + 15$	1/2
	The product of their ages is 480	1/2
	<i>i.e.</i> $(x + 19)(x + 15) = 480$	
	$x^2 + 19x + 15x + 285 = 480$	
	$x^2 + 19x + 15x + 285 - 480 = 0$	1/2
	$x^2 + 34x - 195 = 0$	1/2
	Last term : $- 195 = + 39 \times - 5$	
	Middle term : $+ 34 = + 39 - 5$	1/2
	$\therefore x^2 + 39x - 5x - 195 = 0$	
	$x(x + 39) - 5(x + 39) = 0$	1/2
	$(x - 5)(x + 39) = 0$	
	$x - 5 = 0$ $x + 39 = 0$	
	$x = + 5$ $x = - 39$	1/2
	\therefore After 5 years the product of their age is 480	1/2
