

# STANDARD 10

## IMPORTANT IDEAS

### RIGHT ANGLES AND CIRCLES

See Dears....  
**ANGLE IN A SEMICIRCLE IS 90°**

\* If we join the ends of a diameter of a circle to a point on the circle, we get a right angle.

$$x + y + (x + y) = 180^\circ$$

$$2(x + y) = 180^\circ$$

$$x + y = \frac{180}{2}$$

$$\underline{x + y = 90^\circ}$$

Dears...  
 This is the secret of  
**The angle At any point on the Semicircle Becomes 90°**

I am  $90^\circ$   
So I am  
On the Circle

Why did you  
say get out  
to me?

I AM  
greater than 90,  
So I am IN

If we join the ends of a diameter of a circle to a point on the circle, we get a right angle.

- \* If we join the ends of the diameter to a point inside the circle, then the angle  $>90^\circ$
- \* If we join the ends of the diameter to a point outside the circle, then the angle  $<90^\circ$

**CHORD, ANGLE, ARC**

Dears...  
Here the Diameter  
divides the circle  
Into two equal parts

Also at any part,  
The angle is  
Right angle

The two arcs  
are called  
Alternate arcs or  
Complementary arcs

“ Here the chord is not a diameter”

Dears....  
Here the angles at the points on the circle are not 90°  
Isn't it?

\*  
Any chord which is not a diameter splits the circle into unequal parts. The angle got by joining any point on the larger part to the ends of the chord is half the angle got by joining the centre of the circle to these ends. The angle got by joining any point on the smaller part to the ends of the chord is half the angle at the centre subtracted from 180°.

The angle made by any arc of a circle on the alternate arc is half the angle made at the centre.

Dears.....  
You know....here  
At the centre,  
 $x^\circ + y^\circ = 360^\circ$

$$\frac{1}{2} x + \frac{1}{2} y = 180^\circ$$

All angles made by an arc on the alternate arc are equal; and a pair of angles on an arc and its alternate are supplementary

**Friends.....**  
 “The sum of angles  
 On the Alternate arcs are  
 supplementary”

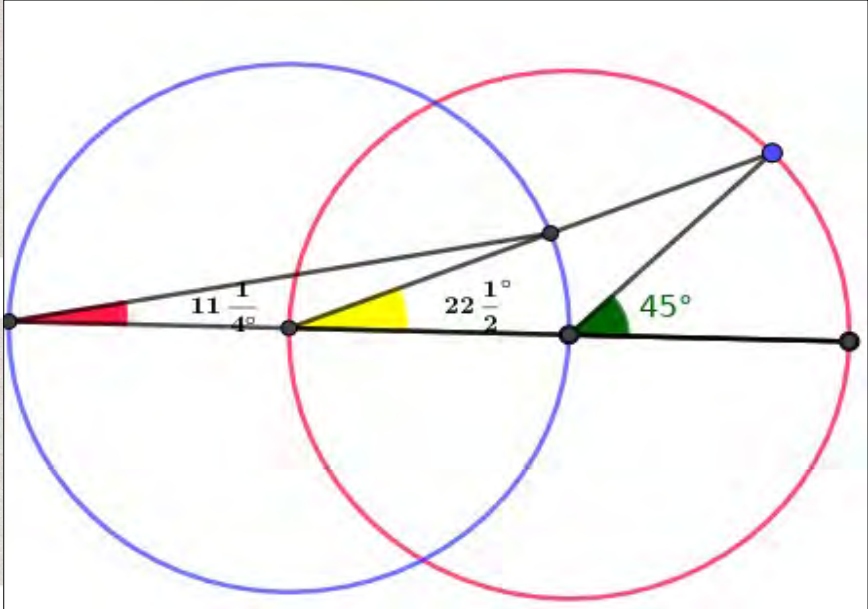

Don't forget ...  
**All angles made by an  
 Arc are same!!**

**CONSTRUCTION**

**Idea: Half Angles**

1. Example: Draw angles  $22\frac{1}{2}^\circ$  and  $11\frac{1}{4}^\circ$

**“WOW!!”**

The angle made by any arc of a circle on the alternate arc is half the angle made at the centre.

**Dears...**  
 We can also use this idea to draw the triangle with specified angles and circumradius.

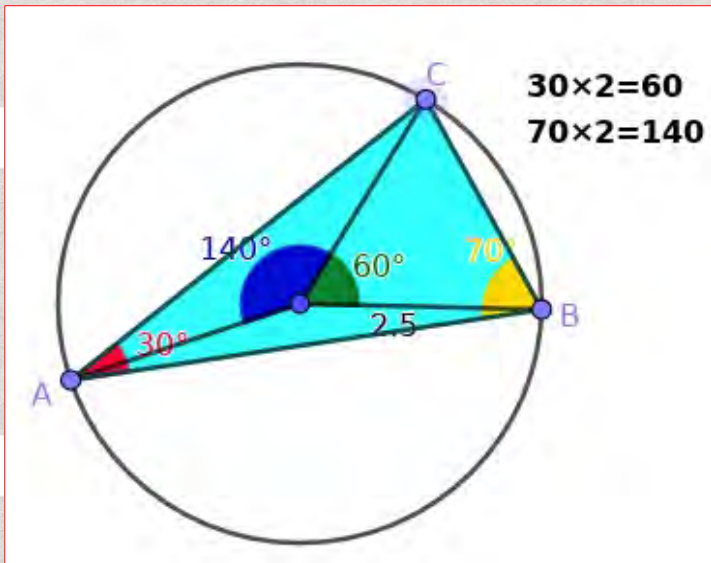

Yes...yes...  
 First draw the circle and Measure the double of Given Angles At the centre

**CONSTRUCTION**

**Idea: Half Angles**

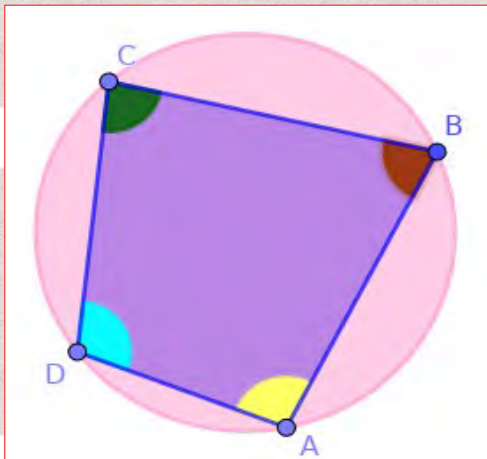

2. Example: Draw a triangle of angles 30°, 70° and of circumradius 2.5 centimetres.

Here  $\Delta ABC$  is the Required triangle

**CIRCLE AND QUADRILATERAL**

Here it is!  
 Quadrilateral ABCD is a Cyclic Quadrilateral

$\ast \angle A + \angle C = 180^\circ$   
 $\ast \angle B + \angle D = 180^\circ$

If all four vertices of a quadrilateral are on a circle, then its opposite angles are supplementary.

- \*  $\angle A + \angle C = 180^\circ$
- \*  $\angle A + \angle F > 180^\circ$
- \*  $\angle A + \angle E < 180^\circ$

Oh! Here,  
 $\angle A$  and  $\angle C$  are not  $90^\circ$   
 Even they are on the circle  
 How is it?

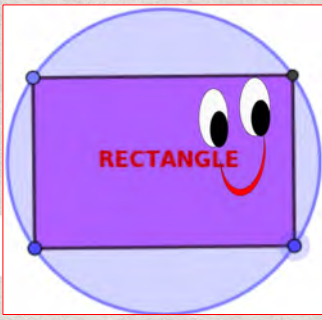

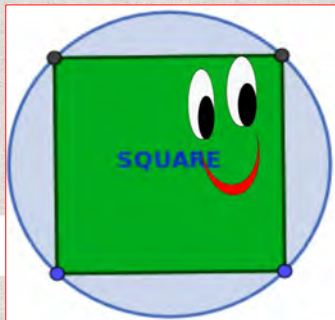

Friend...  
 I got it!  
 $\angle A$  and  $\angle C$  are in the  
 Alternate arcs. So  
 They are supplementary!

If one vertex of a quadrilateral is outside the circle drawn through the other three vertices, then the sum of the angles at this vertex and the opposite vertex is less than  $180^\circ$ , if it is inside the circle, the sum is more than  $180^\circ$ .

Here,  
**Opposite angles of these quadrilaterals**  
 are always  
**supplementary**

We are Always  
**Cyclic Quadrilaterals** 😊

## TWO CHORDS

$$\angle A = \angle D \text{ and } \angle C = \angle B$$

So  $\triangle PAC$  and  $\triangle PBD$  are similar.

Then 
$$\frac{PA}{PD} = \frac{PC}{PB}$$

And 
$$PA \times PB = PC \times PD$$

If two chords of a circle intersect within the circle, then the products of the parts of the two chords are equal.

## CONSTRUCTION

**Idea:  $PA \times PB = PC \times PD$**

3. Draw a rectangle of width 6cm and height 2cm. Draw another rectangle of the same area with width 7cm.

- \* Draw the rectangle with the width 6cm and height 2cm.
- \* Extend 6cm to 2cm more to get 8cm as base. ( $AB=8\text{cm}$ )
- \* Extend the height of the rectangle to 5cm more to get total 7cm as the new required length.
- \* Join AC and BC to get  $\triangle ABC$
- \* Draw the perpendicular bisectors of any two sides of  $\triangle ABC$  to get the Circum centre.
- \* Draw circumcircle of  $\triangle ABC$ .
- \* Now  $PC=7\text{cm}$  is the length of the new rectangle and  $PD$  is its breadth.
- \* Take these lengths on compass to Complete the new rectangle PEFC.
- \* Then areas of both rectangles are Equal since  $PA \times PB = PC \times PD$

If two chords of a circle intersect within a circle, then the rectangles formed by the parts of the same chord have equal area.

## TWO CHORDS

The perpendicular from the centre to a chord bisects the chord.

$$\therefore PC = PD$$

$$PA \times PB = PC \times PD$$

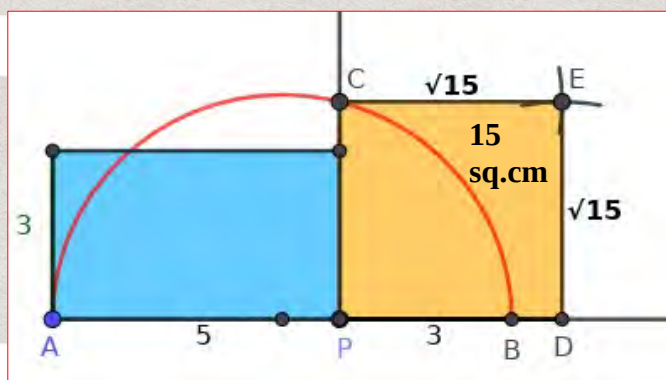

$$\therefore PA \times PB = PC^2$$

The area of the rectangle formed of parts into which a diameter of a circle is cut by a perpendicular chord is equal to the area of the square formed by half the chord.

## CONSTRUCTION

Idea:  $PA \times PB = PC^2$

4. Draw a rectangle of width 5 centimetres and height 3 centimetres.  
Draw a square of the same area.

- \* Draw the rectangle with length 5cm and breadth 3cm.
- \* Extend AP to 3cm more to get  $AB = 8\text{cm}$ .
- \* Draw a semicircle with AB as the Diameter.
- \* Extend the breadth to meet the Semicircle at C.
- \* PC is the side of the required Square.
- \* Complete the square with PC as one Side.
- \* PDEC is the required square with Area 15 sq.cm using the idea

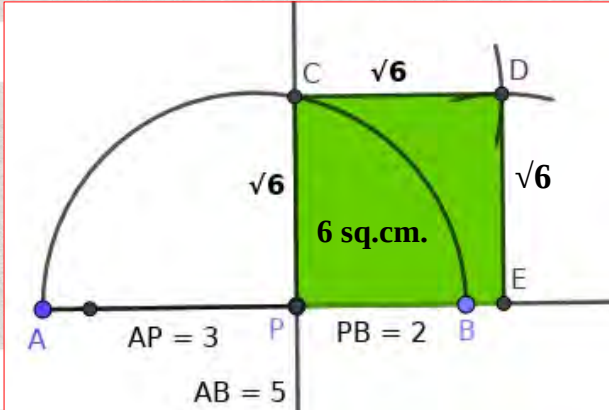

$$PA \times PB = PC^2$$

## CONSTRUCTION

Idea:  $PA \times PB = PC^2$

5. Draw a square of area 6 square centimetres (Without drawing the rectangle).

- \* Draw a line  $AB=5$  cm and mark a Point  $P$ , 3cm away from  $A$ .
- \* Draw a semicircle with  $AB$  as Diameter.
- \* Draw a perpendicular to  $AB$  at  $P$ .
- \* Let it meet the semicircle at  $C$
- \*  $PC=\sqrt{6}$  is the side of the new Square and area 6 sq.cm.
- \* The quadrilateral  $PCDE$  is the Required Square.

## TWO CHORDS

In the picture, chords  $AB$  and  $CD$  of the circle are extended to meet at  $P$ . Then  $PA \times PB = PC \times PD$ .

- \* Consider  $\Delta PBD$  and  $\Delta PAC$
- \*  $\angle PAC = \angle PDB$  and  $\angle PCA = \angle PBD$   
(any outer angle of a cyclic quadrilateral is equal to the Inner angle at the opposite vertex)
- \*  $\angle P$  is common to both triangles
- \* So  $\Delta PBD$  and  $\Delta PAC$  are similar.

$$\frac{PB}{PD} = \frac{PC}{PA}$$

- \*  $PA \times PB = PC \times PD$
